

# Customer information about the use of PFAS in our company

(Per- and polyfluoroalkyl substances)

We would like to inform you about the current status regarding upcoming restrictions on per- and polyfluoroalkyl substances (PFAS).

The timetable for PFAS restriction procedures was updated at the last RAC and SEAC meeting on 5 December 2024. The following sectors were discussed:

- Applications of fluorinated gases
- transport
- construction products

Further sectors (lubricants, medical devices, electronics and semiconductors) are to follow in March 2025. Affected substances and limit values for the electronics and semiconductors sector have not yet been defined.

## **There are currently no regulations or guidelines.**

We can inform you in advance that no substances of the PFAS substance class are processed in our chemical products.

The packaging and printed products which we use do not contain any PFAS.

As we do not yet have any information on limit values or bans for individual substances, we must wait for the final ECHA regulation for a statement on our Testomat series measuring devices.

We will continue to monitor the development of the future regulation of limit values with PFAS and will issue a manufacturer's declaration when the regulation has entered into force.

Responsible for product management
